

Collecting Light

About 200 years ago, Niépce had an idea of fixing the sight in front of him by the technology of using light without requiring manual labor. It was not just his original idea. Instead, it was also the result that he was synchronized with in the time called “modern” when science and technology fascinated a lot of people as the way of making a better life.

His dream almost came, but unfortunately, he could not witness the moment of the accomplishment.

After his death Daguerre, who was the collaborator of Niépce, continued his legacy. Then, He finally accomplished Photography, Daguerreotype.

If I could share with a lot of people the history of the science technology called Photography through this attempt, again, what would happen? That is the strongest interest for me now.
